$B^0 - \overline{B^0}$ Mixing

- Allows us to determine the CKM matrix elements
- Dominant contribution in SM: box diagram with top quarks

 Experimental error of ΔM_q is better than a percent; lattice uncertainty for ξ is about 3%

Introduction	Actions	Tuning	Results bb	LPT	B-physics	Conclusion
0000	000	000	00	00	0000	
-						
$B \rightarrow \pi I$	ν torm to	actor				

► Allows to determine the CKM matrix element V_{ub} from the experimental branching ratio

$$\frac{d\Gamma(B \to \pi I \nu)}{dq^2} = \frac{G_F^2 |V_{ub}|^2}{192 \pi^3 M_B^3} \left[(M_B^2 + M_\pi^2 - q^2)^2 - 4M_B^2 M_\pi^2 \right]^{3/2} |f_+(q^2)|^2$$

▶ Tension between exclusive determination and inclusive determinations of V_{ub} is greater than 3σ

Possible Deviations from the Standard Model

[Lunghi and Soni 2010/11]

- **•** Experimental value for $sin(2\beta)$ is 3.3σ lower than SM expectation
- ▶ Measured value for $\mathsf{BR}(B o \pi l \nu)$ is 2.8 σ lower than predicted
- ▶ Most likely source of deviation in $B_{d(s)}$ mixing and sin(2 β); less likely in $B \rightarrow \tau \nu$

[Laiho, Lunghi and Van de Water 2012,

```
http://www.latticeaverages.org]
```

▶ Scenario in which new physics is in $B \rightarrow \tau \nu$ decay and/or in B_d -mixing preferred

▶ If tension is taken at face value, points to physics at a few-GeV mass scale

Our Project

 Use domain-wall light quarks and nonperturbatively tuned relativistic b-quarks to compute at few-percent precision

▶ $B^0 - \overline{B^0}$ mixing

- ▶ Decay constants f_B and f_{B_s} [this talk]
- $ightarrow B
 ightarrow \pi \ell
 u$ form factor [Talk by T. Kawanai, today 5:40 PM]
- Tune RHQ parameters using bottom-strange states and high statistics
 Improve upon exploratory studies and verify made assumptions
 Validate tuning procedure by computing bb masses and splittings
- Derive lattice perturbation theory for matching lattice results to continuum 1-loop in tadpole-improved lattice perturbation [Talk by C. Lehner, Thursday, 3:50 PM]
 - ▶ Improve matching using a mostly-nonperturbative scheme for f_B , f_{B_s} and $B \rightarrow \pi \ell \nu$

Relativistic Heavy Quark Action for the *b*-Quarks

- Relativistic Heavy Quark action developed by Christ, Li, and Lin for the *b*-quarks in 2-point and 3-point correlation functions [Christ, Li, Lin 2007; Lin and Christ 2007]
- Builds upon Fermilab approach [El Khadra, Kronfeld, Mackenzie 1997] by tuning all parameters of the clover action non-perturbatively; close relation to the Tsukuba formulation [Aoki, Kuramashi, Tominaga 2003]
- Heavy quark mass is treated to all orders in $(m_b a)^n$
- Expand in powers of the spatial momentum through $O(\vec{p}a)$
 - Resulting errors will be of $O(\vec{p}^2 a^2)$
 - Allows computation of heavy-light quantities with discretization errors of the same size as in light-light quantities
- Applies for all values of the quark mass
- Has a smooth continuum limit

Tuning the Parameters of the RHQ Action

$$S = \sum_{n,n'} \bar{\Psi}_n \left\{ m_0 + \gamma_0 D_0 - \frac{aD_0^2}{2} + \zeta \left[\vec{\gamma} \cdot \vec{D} - \frac{a\left(\vec{D}\right)^2}{2} \right] - a \sum_{\mu\nu} \frac{ic_P}{4} \sigma_{\mu\nu} F_{\mu\nu} \right\}_{n,n'} \Psi_{n'}$$

▶ Start from an educated guess for m_0a , c_P , and ζ

$$\begin{bmatrix} m_{0}a\\c_{P}\\\zeta\end{bmatrix} \pm \begin{bmatrix} \sigma_{m_{0}a}\\0\\0\end{bmatrix}, \begin{bmatrix} 0\\\sigma_{c_{P}}\\0\end{bmatrix}, \begin{bmatrix} 0\\0\\\sigma_{\zeta}\end{bmatrix}, \begin{bmatrix} 0\\0\\\sigma_{\zeta}\end{bmatrix}, \begin{bmatrix} \sigma_{0}\\\sigma_{c_{P}}\\\sigma$$

Introduction	Actions	Tuning	Results bb	LPT	B-physics	Conclusion
0000	000	000	00	00	0000	

▶ Compute for all seven parameter sets

Assuming linearity

$$Y_{r} = \begin{bmatrix} \overline{M} \\ \Delta_{M} \\ \frac{M_{1}}{M_{2}} \end{bmatrix}_{r} = J^{(3\times3)} \begin{bmatrix} m_{0}a \\ c_{P} \\ \zeta \end{bmatrix}_{r} + A^{(3\times1)} \qquad (r = 1, \dots, 7)$$

and defining

$$J = \begin{bmatrix} \frac{Y_3 - Y_2}{2\sigma_{m_0 a}}, \frac{Y_5 - Y_4}{2\sigma_{c_P}}, \frac{Y_7 - Y_6}{2\sigma_{\zeta}} \end{bmatrix} \qquad A = \begin{bmatrix} M \\ \Delta_M \\ \frac{M_1}{M_2} \end{bmatrix}_1 - J \times \begin{bmatrix} m_0 a \\ c_P \\ \zeta \end{bmatrix}_1$$

▶ We extract the RHQ parameters and iterate until result is inside uncertainties

$$\begin{bmatrix} m_0 a \\ c_P \\ \zeta \end{bmatrix}^{\mathsf{RHQ}} = J^{-1} \times \left(\begin{bmatrix} \overline{M} \\ \Delta_M \\ \frac{M_1}{M_2} \end{bmatrix}^{\mathsf{PDG}} - A \right)$$

Predictions for the Heavy-Heavy States

- ▶ RHQ action describes heavy-light as well as heavy-heavy mesons
- ▶ Tuning the parameters in the *B_s*-system we can predict bottomonium states and mass splittings

$$\begin{split} \Upsilon &= 9410(30)(38) \text{ MeV} \quad h_b = 9862(36)(39) \text{ MeV} \quad M_{\Upsilon} - M_{\eta_b} = 49(02)(17) \\ \eta_b &= 9350(33)(37) \text{ MeV} \quad \chi_{b1} = 9851(35)(39) \text{ MeV} \quad M_{\chi_{b1}} - M_{\chi_{b0}} = 38(01)(16) \\ \chi_{b0} &= 9808(35)(39) \text{ MeV} \quad [\Upsilon. \text{ Aoki et al. } 2012] \end{split}$$

RHQ Lattice Perturbation Theory [C. Lehner]

Motivation

Knowing the RHQ parameters nonperturbatively we can compare the outcome with lattice perturbation theory

Helps to build confidence that lattice perturbation theory is working also in cases where we do not have fully non-perturbative matching (e.g. decay constants, form factors)

Method

- ▶ Computation at 1-loop order
- Mean field improved
- ▶ Use nonperturbative inputs for $\langle P \rangle$, $\langle R \rangle$, $\langle L \rangle$ and $m_0 a$
- ▶ Predict: c_P and ζ
- \blacktriangleright Naive $\alpha_{\rm S}^2\sim 5\%$ power-counting estimate

- ▶ Central values: average of one-loop mean-field improved values computed with u_0 obtained from the plaquette and from the spatial Landau link
- **\triangleright** Error on perturbative c_P : difference between mean field methods dominates
- Frror on perturbative ζ : naive power-counting dominates
- Nonperturbative values include systematic errors from discretization errors in quantities used for tuning
- \blacktriangleright Agreement within errors \Rightarrow MF-improved LPT can be trusted in situations for which NP matching factors are not available

B-meson Decay Constant Calculation

- ► Use point-source light quark and generate Gaussian smeared-source heavy quark
- Computation performed with seven paramter box and interpolated to the tuned RHQ parameters
- Axial current will be 1-loop O(a) improved
- ▶ Result will use mostly nonperturbative renormalization
- \blacktriangleright Combined chiral and continuum extrapolation using heavy meson $\chi {\rm PT}$

Mostly Nonperturbative Renormalization

For f_B , f_{B_s} and $B \rightarrow \pi$ we plan to compute mostly non-perturbative renormalization factors á la [El Khadra et al. 2001]

$$\varrho^{bl} = \frac{Z_V^{bl}}{\sqrt{Z_V^{bb} Z_V^{ll}}}$$

- Compute Z_V^{ll} and Z_V^{bb} non-perturbatively and only ϱ^{bl} perturbatively
- ► Enhanced convergence of perturbative serious of *ρ^{bl}* w.r.t. *Z^{bl}_V* because tadpole diagrams cancel in the ratio
- \blacktriangleright Bulk of the renormalization is due to flavor conserving factor $\sqrt{Z_V'' Z_V^{bb}} \sim 3$
- ρ^{bl} is expected to be of $\mathcal{O}(1)$; receiving only small corrections
- For domain-wall fermions Z_A = Z_V + O(m_{res}) i.e. we know Z^H_V [Y. Aoki et al. 2011], Z^{bb}_V computed on 24³ [Talk by T. Kawanai]

0000	000	000	00	00	0000	

Very Preliminary Results — small scaling violations

- \blacktriangleright Results for f_{B_S} obtained by simulating close to the physical strange quark mass
- Renormalization and matching to be improved: nonperturbative Z^{ll}_V; perturbative Z^{bb}_V; (tree level, 20% error); ρ_{bl} = 1
- Axial current only tree-level O(a) improved

Preview on f_B

- ▶ Data obtained on three ensembles: red $m'_{sea} = 0.006$ (32³, $a \approx 0.08$ fm); blue $m'_{sea} = 0.005$, cyan $m'_{sea} = 0.010$ (both 24³, $a \approx 0.11$ fm)
- Independent, correlated 2-parameter fit to the three lowest valence quark masses of each ensemble

Introduction 0000	Actions 000	Tuning 000	Results <i>bb</i>	LPT OO	B-physics	Conclusion
Conclus	ion					

- We have completed tuning the parameters of the RHQ action for b-quarks, and find good agreement between our predictions for bottomonium masses and fine splittings with experiment.
- Given this success, we are now using this method for B-meson quantities such as decay constants, neutral B-meson mixing parameters and form factors, and expect to obtain errors competitive with other groups.
- The RHQ action can also be used for charm quarks, and Hao Peng is currently performing the necessary parameter tuning.
- ▶ We should have first results within the next year, and maybe sooner!
